

Wikipedia interest: Astronomy

Ukrainian (uk) · Polish (pl) · Czech (cs) | 2024-09 to 2026-08 | Wikidata Q333: natural science studying celestial objects and phenomena in the cosmos

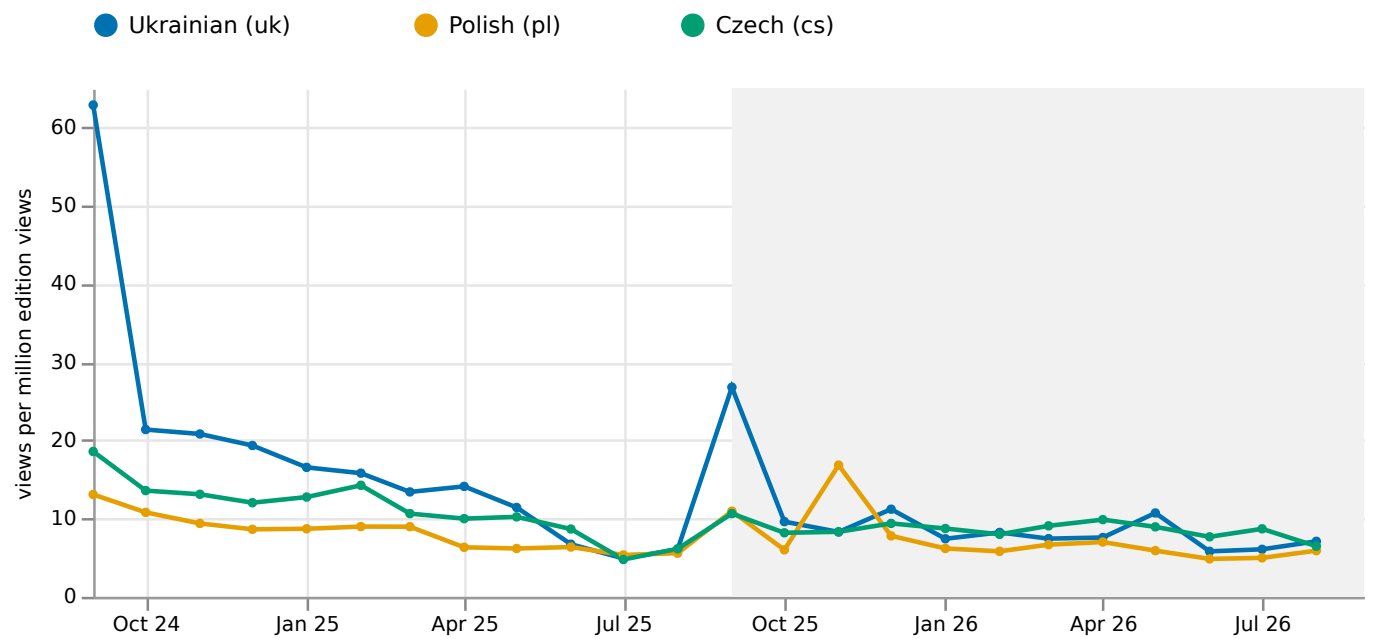

Question: Is interest in astronomy growing in Ukrainian Wikipedia, and how much can we trust it?

ANSWER

No. Ukrainian interest in astronomy fell 60% year over year, and its share of all Ukrainian Wikipedia views fell 46%, so this is a real topic decline, not just lower Wikipedia traffic. The drop shows up in 11 of 12 months, so confidence is high. Czech (-33%) and Polish (-16%) are declining too, but Ukrainian readers still show the highest relative interest (9.9 views per million).

Monthly interest, normalized by the size of each language edition

Shaded: the most recent 12 months, compared with the 12 before them.

Language / article	Views/ month	Per million	Change YoY	Share change	Direction	Confidence
Ukrainian: Астрономія	559	9.9	−60%	−46%	Declining	High
Polish: Astronomia	1,431	7.6	−16%	−8%	Declining	Medium
Czech: Astronomie	516	8.7	−33%	−24%	Declining	High

Why confidence is not higher

- Polish: Raw views are declining (-16%) but the topic's share of all views in this language is flat (-8%): much of the move reflects overall Wikipedia traffic, not this topic.

Method: human pageviews (bots excluded) of the article linked to the same Wikidata item in each language. Change = last 12 months vs the 12 before (cancels seasonality). Share change = the same, as a share of all views in that language edition (removes Wikipedia-wide traffic shifts). Per million = article views per million edition views. Limits: pageviews reflect curiosity, not willingness to pay; one article stands in for a topic; a language is not a country. Source: Wikimedia Pageviews API, Wikidata.
